

Remote Workers

The Challenge

Mobile workers are often supplied with multiple devices connected via an internal SIM or dongle. With no one mobile network covering 100% of the country, relying on a single provider provides no connection stability or reliability.

This inability to connect leads to time losses and inefficient uses of the workforce as they search for a signal to access critical company systems.

The Solution

Increase reliability and coverage with a multiple SIMs solution using various providers, with Bonding and Hot Failover technology.

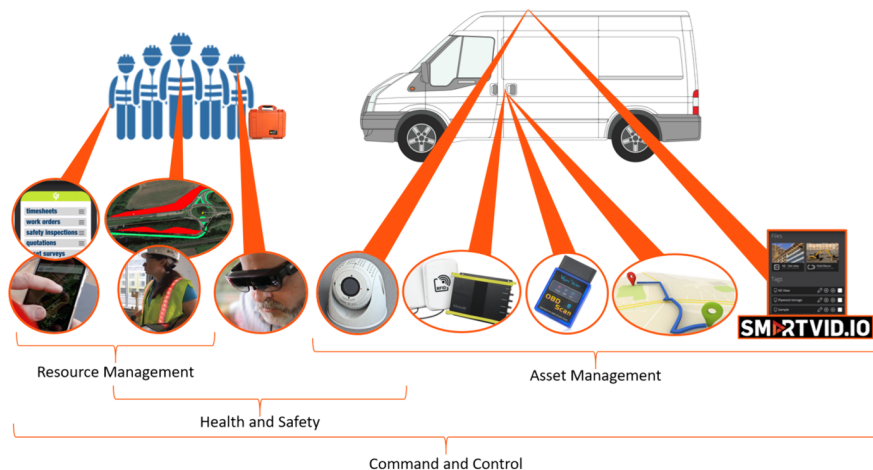

The **Connected Vehicle Hub** or waterproof carry **NetCase** solution provide a secure connection no matter the location.

Know where your workforce is too with built in GPS tracking and telematics capabilities.

The Result

With a better connected workforce, other applications and services can be implemented to deliver productivity improvements and drive a healthier safer environment for your workers.

Onwave can also offer services that help with these enhanced solutions including Resource Management, Asset Management and Command and Control.

*"Using Onwave has helped us to **meet the requirements of rapidly** deploying IT connectivity to our projects. This solution ensures our **employees can be properly supported** as well as allowing access our internal network resources. **Our joint venture partners and subcontractors also benefit by having access to high speed internet access on day-one of landing on site.** We have around 40 sites connected using the service consuming on average two terabytes of data per month."*
